

## ION-MIN Standards

Clay has been used topically for thousands of years. Just think of the ancient nomadic tribes of Africa and even North American Indian Tribes that had to improvise when their skin was injured or if they had a bacterial infection. They found clay and its incredible anti-bacterial properties have saved many lives since then. It relieves pain from bites, cuts scratches when applied directly to the area of concern. The anti-bacterial properties of clay detoxifies as it cleans the skin. Skin loves the trace minerals in montmorillonites and responds positively to its use as a topical aid.

Researchers, Shelley Haydel and Lynda Williams of ASU teamed up to study the remarkable antibacterial properties of montmorillonite clays. They were astounded to find that Montmorillonite clay compounds are among the most potent antibiotics that can fight even the most dangerous "flesh-eating" bacteria.

National Institutes of Health (NIH) program directors were interested too. They awarded a \$438,970 grant over two years to Williams and Haydel for the study of clay mineral alternative treatment for Buruli ulcers. What makes this award even more interesting is the rarity for a geochemist to net a NIH grant.

Notes, Lynda Williams: "we're closer than ever before to understanding 'healing clays'." The team is continuing its antibacterial clay research, but the discovery is actually an application of an age-old remedy. The power of active, ionic Montmorillonite clay to heal, detoxify, disinfect and support healthy living.

Clay is not dirty. On the contrary, it is the essence of *clean*! Some clay compounds are antibacterial, antimicrobial and antitoxin. Such is ION-MIN, a premium calcium Montmorillonite clay, available from California Earth Minerals' Dealers and Distributors both Domestic U.S and International.
